

Commonly Asked Questions About Mountain Lions

How many mountain lions are in California?

Any statewide estimate of the mountain lion population is just a "guesstimate." Mountain lion studies over the last 30 years have estimated population densities for different habitat types around the state. These density estimates varied from zero to 10 lions per 100 square miles, and were simply expanded to the total amount of each habitat type available. This method provides a crude estimate of between 4,000 and 6,000 mountain lions statewide.

Where are mountain lions found in California?

More than half of California is prime mountain lion habitat. Generally speaking, mountain lions can be found wherever deer are present, since deer are a mountain lion's main food source. Foothills and mountains are most suitable mountain lion habitat, while valleys and deserts are considered unsuitable.

Are mountain lion numbers increasing or decreasing in California?

Without an ongoing statewide mountain lion study, it is impossible to know what is happening on a statewide basis with populations. However, there are indications that mountain lion activity, such as depredation, attacks on people, and predation on prey populations, peaked in 1996, then decreased somewhat, and have remained stable for the past several years.

What constitutes a public safety threat?

Under the DFG's Public Safety Wildlife Guidelines, an animal is deemed to be a public safety threat if there is "a likelihood of human injury based on the totality of the circumstances." Factors that are considered include the lion's behavior and its proximity to schools, playgrounds and other public gathering places. The determination of whether an animal is a public safety threat is made by the DFG or local law enforcement personnel on the scene.

What happens to a mountain lion that is declared a public safety threat?

The DFG or law enforcement personnel on scene will secure the area, then locate and kill the offending animal as soon as possible. The DFG does not relocate mountain lions that are a threat to public safety.

Why can't the animal be captured and moved to suitable habitat that is more remote?

When an animal is displaying unusually bold or aggressive behavior toward humans, the DFG will not relocate the animal because of the risk it could pose to others.

Is it possible to find a home for the mountain lion in a wildlife sanctuary?

When a mountain lion is declared a public safety threat, the DFG's goal is to eliminate the threat in the most humane manner possible. Capturing a wild animal that is accustomed to traveling great distances and confining it to a relatively small enclosure is not a humane option.

How often are mountain lions declared public safety threats in California?

The DFG receives hundreds of reported mountain lion sightings annually statewide, but fewer than three percent turn out to be verified public safety threats. During 2002 there were 13 public safety mountain lions killed. During 2001 there were 14.

What causes a mountain lion to display unusually bold behavior toward humans?

Sometimes disease will cause an animal to behave strangely. Some mountain lions killed for public safety reasons have tested positive for feline leukemia. A mountain lion that attacked a man in Mendocino County in 1994 tested positive for rabies.

Usually, there is no apparent explanation for why a mountain lion seems to abandon its instinctive wariness of humans. Mountain lions are typically solitary and elusive. Studies of collared mountain lions show that they often co-exist around people, unseen and unheard.

If I live in mountain lion habitat, how concerned should I be for my safety?

Statistically speaking, a person is one thousand times more likely to be struck by lightning than attacked by a mountain lion. That said, mountain lions are wild animals and, like any wildlife, can be dangerous. People who live in mountain lion habitat can take precautions to reduce their risk of encountering a mountain lion. By deer-proofing the landscape, homeowners can avoid attracting a lion's main food source. Removing dense vegetation from around the home and installing outdoor lighting will make it difficult for mountain lions to approach unseen.

Are mountain lion attacks on humans common?

Mountain lion attacks on humans are rare. There have been only 15 verified mountain lion attacks on humans in California since 1890, six of them fatal. The last documented attack occurred in June, 2004 in Tulare County.

Are mountain lion attacks on pets/livestock common?

It has become increasingly common for mountain lions to prey on pets and livestock as more people move into mountain lion habitat. The DFG received hundreds of reports annually of mountain lions killing pets and livestock.
